

Leave Tracker Pro Documentation

Overview

Leave Tracker Pro is an all-in-one workforce management application designed to streamline employee leave management, bug tracking, event updates, and company policy access. It provides a structured platform for employees to request leaves, report issues, access policies, and engage with company activities while enabling managers and admins to oversee and take necessary actions efficiently.

Pages and Features

1 Dashboard

- Displays an overview of employees and their details.
- Quick access to key features like leaves, updates, bug reports, and notifications.
- Admins and managers can view real-time statistics.

2 View Updates

- Shows all employee updates and logs.
- Managers can filter updates by date, designation, and task status.
- Employees can track their own progress and submitted updates.
- Export feature available (Excel/PDF).

3 View Leaves

- Displays employee leave records.
- Managers can approve/reject leave requests.
- Employees can view their leave history and status.
- Filtering by leave type, duration, and status.
- Export feature available (Excel/PDF).

4 My Profile

- Displays personal user details.
- Allows users to update their information and preferences.

5 Register User

- HR can add new employees.
- Assigns departments and roles during registration.

6 Report Bug

- Employees can report technical issues.
- Supports image upload (stored in Cloudinary).
- Super Admin can review and track reported bugs.

7 View Bugs

- Displays a list of all reported bugs.
- Only accessible to the Super Admin for issue resolution.

8 Leave Policy

- Contains a PDF document outlining the company's leave policies.

9 Travel & Expenses Policy

- Displays travel reimbursement and expense policies.

10 Upcoming Events

- Shows company-wide events and announcements.

11 Upcoming Holidays

- Lists all public and company-declared holidays.

1 2 Settings

- Users can update their preferences and notifications.

1 3 FAQs

- Answers to common questions regarding leave requests, company policies, and app functionalities.

1 4 Documentation

- Provides detailed documentation about the app's features and usage.

API Routes

◇ API Endpoints Overview

The following API endpoints manage various functionalities within the app:

- **/api/delete-user** → Deletes a user from Firebase Auth and removes their details from the Firebase collection.
- **/api/read-cookie** → Reads stored cookies for authentication and session management.
- **/api/send-email** → Sends an email containing new user account details, including login credentials.
- **/api/send-notification** → Sends notification emails to users when their leave is approved or rejected, or for other important updates.
- **/api/upload-image** → Allows users to upload images/screenshots when reporting bugs. The images are stored on Cloudinary, and the URL is saved in the Firebase Bugs collection for super admins to review.

Note: All emails are sent using **Nodemailer** for reliable email delivery.

Folder Structure

- **.next** → Build files for Next.js.
- **app** → Contains all pages and API routes.
- **components** → Reusable UI components.
- **config** → Configuration files for Firebase, authentication, and environment variables.
- **context** → Context API for managing global state.
- **DefaultData** → Default JSON data used in the app.
- **emails** → Templates for emails sent via Nodemailer.
- **functions** → Utility functions for processing data.
- **HOC** → Higher Order Components for authentication and role-based access control.
- **hooks** → Custom React hooks used in the application.
- **interfaces** → TypeScript interfaces and types.
- **JSON** → Static JSON files for predefined data.
- **node_modules** → Project dependencies.
- **public** → Static assets such as images and icons.
- **styles** → CSS and Tailwind styling files.
- **.env.local** → Environment variables file.
- **next.config.js** → Next.js configuration file.
- **package.json** → Contains project dependencies and scripts.
- **tailwind.config.ts** → Tailwind CSS configuration.
- **tsconfig.json** → TypeScript configuration.

Conclusion

Leave Tracker Pro is a comprehensive workforce management platform that enhances efficiency in leave tracking, issue reporting, and policy access. The application is designed to improve employee experience while ensuring managers and admins can seamlessly oversee operations. Continuous updates and improvements are planned to expand features and optimize performance.
